Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                  ö
                                                                                               infiltrating lymphocytes. The epitope or a vector encoding the epitope is used to treat cancer, particularly melanoma expressing HLA-CW staterisk 0702. The epitope has widespread utility in cancer immunotherapy since MAGE-12 is mostly found in tumours. The present sequence is human MAGE-12 T-cell epitope.

These antigenic peptides when presented by an antigen presenting cell having a HLA class I molecule, effectively induce the activation and proliferation of CD8+ cytotoxic T lymphocytes. MAGE-A12 is useful for treating a subject having a disorder characterised by expression of MAGE-A12. The protein microarray comprising MAGE-A12 is useful for diagnosing a disorder, especially cancer, by determining the binding of an antibody, T lymphocytes or a HLA molecule isolated from the subject suspected of having the disorder characterised by the expression of MAGE-A12. MGE-A12 is useful for treating cancers, including bladder carcinomas, melanomas, oesophageal, lung, head and neck, ibreast, colorectal carcinomas, myelomas, brain tumours, sarcomas,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antigenic peptides derived from MAGE-A12 polypeptides, useful for diagnosis and treatment of cancer, such as bladder, lung, breast, brain, prostate and renal carcinomas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; cytostatic; immunogen; MAGE-A12; human leukocyte antigen; HLA; CD8; cytotoxic T lymphocyte; cancer; carcinoma; melanoma; myeloma; brain tumour; sarcoma; vaccine; gene therapy.
                                                                                                                                                                                                                                                                                    Gaps
                                               The invention relates to an isolated and purified T cell epitope candGE-12. MAGE-12 is a tumour rejection antigen for melanoma which expresses MHC-class I molecule HLA-Cw0702 recognised by tumour-
                                                                                                                                                                                                                                                                                  ;

The patent discloses antigenic peptides derived from MAGE-A12

protein and presented by human leukocyte antigens (HLAs). These
antigenic peptides when presented by an antigen (HLAs). These
antigenic peptides when presented by an antigen presenting cell
having a HLA class I molecule, effectively induce the activation
and proliferation of CD8+ cytocxic T lymphocytes. MAGE-A12 is
useful for treating a subject having a disorder characterised by
expression of MAGE-A12. The protein microarray comprising MAGE-A12
is useful for diagnosing a disorder, especially cancer, by determining
the binding of an antibody, T lymphocytes or a HLA molecule isolated
from the subject suspected of having the disorder characterised by the
cxpression of MAGE-A12. MAGE-A12 is useful for treating cancers,
including bladder carcinomas, melanomas, oesophageal, lung, head and
neck, breast, colorectal carcinomas, myelomas, brain tumours, sarcomas,
prostate and renal carcinomas and to produce antibodies. MAGE-A12
antibodies are useful for diagnosing disorders characterised by
cexpression of MAGE-A12 immunogenic polypeptide. These MAGE-12 peptides
are used as vaccines. They are also used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
prostate and renal carcinomas and to produce antibodies. MACE-Al2 antibodies are useful for diagnosing disorders characterised by expression of MACE-Al2 immunogenic polypeptide. These MAGE-12 peptides are used as vaccines. They are also used in gene therapy. The present sequence is MAGE-Al2 HLA class I-binding peptide. This antigenic peptide is presented by major histocompatibility complex (MHC) and is recognised by CTLs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antigenic peptides derived from MAGE-A12 polypeptides, useful for diagnosis and treatment of cancer, such as bladder, lung, breast, brain, prostate and renal carcinomas -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; cytostatic; immunogen; MAGE-Al2; human leukocyte antigen; HLA; CD8; cytotoxic T lymphocyte; cancer; carcinoma; melanoma; myeloma; brain tumour; sarcoma; vaccine; gene therapy.

The nonapeptide can be used in a vaccine to treat a cancerous condition involving HLA-Ah subtype cancerous cells. The nucleic acid encoding the nonapeptide can be used as a probe to identify tumour cells. This sequence is homologous to the peptide described and is encoded by the MAGE-21 gene.
The present sequence is MAGE-A12 HLA class-I-binding peptide. This antigenic peptide is presented by major histocompatibility complex (MHC) and is recognised by CTLS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nona:peptide derived from tumour rejection antigen precursor - presented by HLA-Al cancer cells, for use in diagnosis or therapy of esp. melanoma and breast cancer.

AAR99343-R99350 represent MAGE nonapeptides, based on the tumour rejection antigen region of the full length MAGE sequences. These peptides were used to design the nonapeptides of the invention (see AAR9933-R99342), which bind to a HLA molecule on a cell, and provoke. Iysis by cytolytic T cells (CTLS) specific for a complex of the HLA molecule and nonapeptide. The nonapeptides can be used diagnostically to identify tumours expressing a particular HLA molecule, or to identify cancer cells. The peptides can also be used therapeutically, to induce a CTL response to tumours (where the peptides are optionally coupled to tumour specific antibodies), or to induce a response by CTLs that are cotherwise inactive. The peptide sequences may also be used to expand the peptides are return to the patient, such as for treating melanoma. Tumour cells can be identified by using DNA encoding the nonapeptides as probes. Non-human cells transformed with the HLA-Al congenerate CTLs, or to detect the presence of CTLs in human samples. The non-human transformed cells, when polytransformed, are universal effector cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ó

The patent discloses antigenic peptides derived from MAGE-A12 protein and presented by human leukocyte antigens (HLAS). These antigenic peptides when presented by an antigen presenting cell having a HLA class I molecule, effectively induce the activation and proliferation of CD8+ cytotoxic T lymphocytes. MAGE-A12 is useful for treating a subject having a disorder characterised by expression of MAGE-A12. The protein microarray comprising MAGE-A12 is useful for diagnosing a disorder, especially cancer, by determining the binding of an antibody. T lymphocytes or a HLA molecule isolated from the subject suspected of having the disorder characterised by the expression of MAGE-A12 is useful for treating cancers,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               including bladder carcinomas, melanomas, oesophageal, lung, head and neck, breast, colorectal carcinomas, myelomas, brain tumours, sarcomas, prostate and renal carcinomas and to produce antibodies. WAGE-Al2 antibodies are useful for diagnosing disorders characterised by expression of MAGE-Al2 immunogenic polypeptide. These MAGE-12 peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antigenic peptides derived from MAGE-A12 polypeptides, useful for diagnosis and treatment of cancer, such as bladder, lung, breast, brain, prostate and renal carcinomas
                                                                                                                                                                   Human; cytostatic; immunogen; MAGE-A12; human leukocyte antigen; HLA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              are used as vaccines. They are also used in gene therapy. The present sequence is MAGE-Al2 HLA class-I-binding peptide. This antigenic peptide is presented by major histocompatibility complex
                                                                                                                                                                                             CD8; cytotoxic T lymphocyte; cancer; carcinoma; melanoma; myeloma;
brain tumour; sarcoma; vaccine; gene therapy.
                                                                                                                    MAGE-A12 human leukocyte antigen-binding peptide #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       82.6%; Score 38; DB 22; I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY4590 to AAY48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes (HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound are particularly important in themour rejection antigen itself, and are particularly important in themour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat. Or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLS ex vivo for infusion back into a patient. The procure is manifested as read to induce a special contacting a cytotoxic T cell with the peptide e.g. to produce CTLS ex vivo for infusion back into a patient. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                     Immunogenic peptide having a human leukocyte antigen binding motif #673.
                                                                                                                                                                                                                    Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tunnor rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;

The present invention describes a composition (1) which comprises at least one human leukocyte antigen (HLA) binding peptide comprising an isolated, prepared epitope comprising one of 547 8-11 residue amino acid sequences (S1), given in AAB75803 to AAB7649. (1) has cytostatic, hepatotropic, antiinflammatory, anti-HIV (human immodeficiency virus) and protozoacide activities, which can be used in vaccine production and is an inducer of cytotoxic T-cell response. (1) is useful for inducing a cytotoxic T cell response against in stocompatibility complex (MHC) class I allele, by contacting cytotoxic T cells (CTLS) from the patient with (I). (I) is useful as a vaccine to treat and/or prevent viral infection and cancer such as prostate cancer, hepatitis B, hepatitis C, human papilloma virus (HPV) infection, cytomegalovirus (CMV), acquired immunodeficiency syndrome (AIDS), renal carcinoma, cervical carcinoma, lymphoma, malaria, and condyloma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  HLA molecule; cytotoxic T cell; immunogenic peptide; binding affinity;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes MAGE2/3 epitopes (I). Also described are: (1) a clonal cytotoxic T lymphocyte (CTL) that is cultured in vivo and bluds to a complex of (I); (2) a peptide (II) comprising (I) and a second epitope and has less than 50 contiguous amino acids; (3) a vaccine composition comprising (II), a unit dose of a peptide with at least 50 contiguous amino acids with 100% identity to the native peptide sequence of MAGE2/3, and a pharmacentical excipient; (4) an isolated nucleic acid encoding (II). (I) has cyclostatic activity, and can be used in vaccines and as an immunostimulant. A vaccine of (3) is useful for the treatment and immunostimulant. A vaccine of (3) is useful for the treatment and immunostimulant. A vaccine of (3) is useful for which circumpass ample from a patient with (I) that binds to an human leukocyte antipen (HLA) allele present in the patient and detecting the presence of the T-lymphocyte that binds to the petind. The vaccine allows the opportunity to combine epitopes derived from multiple tumour-associated molecules reducing the likelihood of tumour escape due to antigen loss. AAG84515 to AAG84909 and AAB99725 crepresent amino acid sequences used in the exemplification of the

                                                                                                                                                                                                                                                                                                                     This sequence represents an immunogenic peptide with binding affinity for HLA-B7-like molecules. A cytotoxic T cell (CTL) response against a particul ar antigen (Ag) is induced in a patient by contacting a CTL with can immunogenic peptide of 9-15 amino acids which binds to at least two an immunogenic peptide of 9-15 amino acids which binds to at least two canderes a cytotoxic T cell response. The immunogenic peptide has a compension of 9 amino acids, comprising a binding motif, with from the condernal primary anchor sites (PAR) at positions 2 (selected from Ala, Leu, Ile, Val, Met, Ser or Thr) and 9 (Arg or Lys) and at least one secondary anchor sites (SAR), i.e. Tyr, Phe or Trp at positions 3, 6 or condernal and therapeutic compositions, for treating viral, pased vaccines and therapeutic compositions, for treating viral, pased vaccines and therapeutic compositions, for treating viral, cor fungal diseases or cancer, e.g. prostatic cancer, hepatitis or condyloma acuminatum. They can also be used to elicit a CTL response or voint viral does not respond to peptide vaccines or other therapies. Che patient does not respond to peptide vaccines or other therapies. Che patient does not respond to peptide vaccines or other therapies. Che patient adminishment in thigher binding condernal cancer of affinity and thus increased immunogenicity.

ANY45390 to AAY48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human newocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes (HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound are particularly important in the intact foreign antigen itself, and are particularly important in the intact foreign antigen itself, and are particularly important in the intact foreign antigen itself, or prevent viral infections and cancers in mammals (especially to treat or prevent viral infections and cancers in mammals (especially bummans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLS ex vivo for infusion back into a patient.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAY45390 to AAY48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukcoyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes ILA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or particularly important in tumour rejection and in fighting viral infections and cancers in mammals (especially humans) or prevent viral infections and cancers in mammals (especially humans) or prevent viral infections as a vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or individuals susceptible or otherwise at risk of viral infection or useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynuclectides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

Cytotoxic T lymphocytes (Tits) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HiA molecule, rather than the infact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cyctoxic T cell response, by contacting a cyctoxic T cell with the peptide e.g. to produce CILS ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAY45390 to AAY48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) class I (also having a human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunogenic peptide having a human leukocyte antigen binding motif #2555.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;
                                                                                                                                                                                                                                                                                                                                                           New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases

                                                                                                                                                                          AAY45390 to AAY48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-AZ.1, A1, A3.2 or A24.10° HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic I lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunogenic peptide having a human leukocyte antigen binding motif #2561
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cance prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;
                                                                                                                                                                                                                                                                                                                                                                        They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CILs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful
                                                                                                    New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases \dot{}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

having a human major histocompatibility complex (MHC) class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLS ex vivo for infusion back into a patient. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                AAY45390 to AAY48214 represent specifically claimed immunogenic peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                 New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 3, Application US/10026001

Patent No. US/2002012791A1

GENERAL INFORMATION:

APPLICANT: Nicolette, Charles A.

TITLE OF INVENTION: ANTIGENIC CK-18 COMPOUNDS FOR THERAPY

TITLE OF INVENTION: AND DIAGNOSIS AND METHODS FOR USING SAME
FILE REFERENCE: GZ 210800

CURRENT APPLICATION NUMBER: US/10/026,001

CURRENT FILING DATE: 2001-12-21

PRIOR FILING DATE: 2000-12-21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 9;
                                                                                                                                                                                                                                                                                                                                                              1; Indels

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                (without alignments)

                                                                                                                                                                                                                                                                                                            XX AC
                                                          protein and presented by human leukocyte antigens (HLAA). These antigenic peptides when presented by an antigen presenting cell having a HLAA class I molecule, effectively induce the activation and proliferation of CD8+ cytocker T lymphocytes. MAGE-A12 is useful for treating a subject having a disorder characterised by expression of MAGE-A12. The protein microarray comprising MAGE-A12 is useful for diagnosing a disorder, especially cancer, by determining the binding of an antibody, T lymphocytes or a HLA molecule isolated from the subject suspected of having the disorder characterised by the expression of MAGE-A12 is useful for treating cancers, including bladder carcinomas, melanomas, oesophageal, lung, head and cneck, breast, colorectal carcinomas, myelomas, brain tumours, sarcomas, prostate and renal carcinomas and to produce antibodies. MAGE-A12 antibodies are useful for diagnosing disorders characterised by expression of MAGE-A12 immunogenic polypeptide. These MAGE-A12 carcinomas and to produce antibodies. MAGE-A12 carcinomas and so used in gene therapy.

The present sequence is MAGE-A12 HLA class I-binding peptide. This antipodie is presented by major histocompatibility complex.
                                                                                                                                                                                                                                                                                                                                                                                           ;

The patent discloses antigenic peptides derived from MAGE-A12
protein and presented by human leukocyte antigens (HLAS). These
antigenic peptides when presented by an antigen presenting cell
antigenic peptides when presented by an antigen presenting cell
having a HLA class I molecule, effectively induce the activation
condition of CD8+ cytotoxic T lymphocytes. MAGE-A12 is
useful for treating a subject having a disorder characterised by
expression of MAGE-A12. The protein microarray comprising MAGE-A12
is useful for diagnosing a disorder, especially cancer, by determining
the binding of an antibody. T lymphocytes or a HLA molecule isolated
from the subject suspected of having the disorder characterised by the
corporation of MAGE-A12. MAGE-A12 is useful for treating cancers,
including bladder carcinomas, melanomas, oseophageal, lung, head and
neck, breast, colorectal carcinomas, myelomas, brain tumours, sarcomas,
prostate and renal carcinomas and to produce antibodies. MAGE-A12
antibodies are useful for diagnosing disorders characterised by
carcinesion of MAGE-A12 immunogenic polypeptide. These MAGE-A12
expression of MAGE-A12 immunogenic polypeptide. These MAGE-A12
expression of waccines. They are also used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
MAGE-12. MAGE-12 is a tumour rejection antigen for melanoma which expresses MHC-class I molecule HLA-Cw0702 recognised by tumourinfiltrating lymphocytes. The epitope or a vector encoding the epitope is used to treat cancer, particularly melanoma expressing HLA-Cw asterisk 0702. The epitope has widespread utility in cancer immunotherapy since MAGE-12 is mostly found in tumours. The present sequence is human MAGE-12 T-cell epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antigenic peptides derived from MAGE-A12 polypeptides, useful for diagnosis and treatment of cancer, such as bladder, lung, breast,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antigen; HLA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    δλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 protein and presented by human leukocyte antigens (HLAS). These antigens to protein and presented by human leukocyte antigens (HLAS). These antigens peptides when presented by an antigen presenting cell having a HLA class I molecule, effectively induce the activation consists I molecule, effectively induce the activation consists I molecule, effectively induce the activation consists and proliferation of CD8+ cytotoxic. I lymphocytes. MAGE-A12 is useful for treating a subject having a disorder characterised by expression of MAGE-A12. The protein microarray comprising MAGE-A12 is useful for diagnosing a disorder, especially cancer, by determining the binding of an antibody. I lymphocytes or a HLA molecule isolated from the subject suspected of having the disorder characterised by the expression of MAGE-A12 is useful for treating cancers, including bladder carcinomas, myelomas, oesophageal, lung, head and neck, breast, colorectal carcinomas, myelomas, brain tumours, sarcomas, prostate and renal carcinomas and to produce antibodies. MAGE-A12 immunogenic polypeptide. These MAGE-A12 peptides are useful for diagnosing disorders characterised by a succines. They are also used in gene therapy.

The present sequence is MAGE-A12 HLA class-I-binding peptide. This antigenic peptide is presented by major histocompatibility complex. (MHC) and is recognised by CTLS.

The nonapeptide can be used in a vaccine to treat a cancerous condition involving HLA-A1 subtype cancerous cells. The nonapeptide can be used as a probe to identify tumour cells. This sequence is homologous to the peptide described and is encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nona:peptide derived from tumour rejection antigen precursor - presented by HLA-Al cancer cells, for use in diagnosis or therapy of esp. melanoma and breast cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       XXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           rejection antigen region of the full length MAGE sequences. These peptides were used to design the nonapeptides of the invention (see AAR9937-R9942), which bind to a HLA molecule on a cell, and provoke 1ysis by cytolytic T cells (CTLS) specific for a complex of the HLA molecule and nonapeptide. The nonapeptides can be used diagnostically to identify tumours expressing a particular HLA molecule, or to identify cancer cells. The peptides can also be used therapeutically, to induce a tesponse to tumours (where the peptides are optionally coupled to tumour-specific antibodies), or to induce a response by CTLs that are otherwise inactive. The peptide sequences may also be used to expand specific CTLs in vitro for later return to the patient, such as for treating melanoma. Tumour cells can be identified by using DNA encoding the nonapeptides as probes. Non-human cells transformed with the HLA Algene and a DNA sequence encoding one of the peptides, can be used to generate CTLs, or to detect the presence of CTLs in human samples. The non-human transformed cells, when polytransformed, are universal effector cells, and can be used in vaccines, or for treating melanoma or breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;

AAY45390 to AAY48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CE HLA-A2.1, Al. A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound or an HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) cray prevent viral infections and cancers in mammals (especially humans) they can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or individuals susceptible or otherwise at risk of viral infection or useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs av vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful thempeutically and for immunisation as above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                   Immunogenic peptide having a human leukocyte antigen binding motif #673
                                                                                                                                                             Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New immunogenic peptides with HLA binding motif, useful in treatment
